

Data Capture Today: A Numbers Game

SMARTER WORKFLOWS: THE DATA CAPTURE TURNING POINT

Doctors who spend > 1 day / week completing documentation

Distant Past

A forgotten era when doctors and patients spoke face-to-face without data to come between them (or help them).

Pre 1990s

Data captured and filed manually. Data is hard to access on-site, inaccessible out of the office, and often (let's be honest) completely illegible.

2000s

Early electronic data capture promises the world and delivers frustration, confusion, and expense.

2014

Free-flow Workflow concept begins to enable greater data capture and promising amounts of patient interaction.

2016

Next-generation Smart Workflows reduces the friction between doctor, data, and patient.

Near Future

Voice-enabled systems bring us back to seamless doctor-patient interaction – with more complete, accurate, and useful data than ever.
